

YOUR DECISION:

SUNEKOS

The regeneration system for dermal biogenesis is a non-invasive medical treatment, consisting in injecting, through fine needles, perfectly biocompatible substances totally absorbable at the level of the middle dermis, favouring, besides a rebalancing of the normal physiological condition, a reactivation of the most vital part of the skin. The feeling of pain is generally poor or absent. The treatment normally lasts about 15-20 minutes and at the end you can immediately resume normal activities, without any medication.

The injected product, Sunekos 200, (or 1200) is a low molecular weight hyaluronic acid in association with a mixture of 6 specific amino acids, such as: glycine, l-valine, l-alanine, l-proline, l-lysine, l-leucine. The last three are called essential amino acids, since the organism is not able to synthesise them in any way, but must necessarily receive them from the outside. Amino acids are the structural units that make up proteins.

The combination of these amino acids with hyaluronic acid is essential to start the dermal biogenesis and cell renewal processes of the skin; once injected, the product will stimulate the activity of skin fibroblasts and the synthesis of collagen and elastin, the two most important structural proteins of our skin. Fibroblasts are cells of the subcutaneous connective tissue of the skin, which produce collagen and elastin using a nutritive support such as the amino acids mentioned above.

Recent scientific studies have in fact shown that the greater the available quantity of these amino acids, the greater the vitality and the number of cells that will produce the new proteins.

The regeneration system for dermal biogenesis mainly involves three functions:

restructuring action, as it promotes cell turnover and the production of collagen, elastin and hyaluronic acid

anti-oxidant action, as it protects the skin from free radicals, produced by environmental factors and solar radiation

moisturising action as it favours the rapid recall of water in the tissues.

It allows you to get noticeable improvements in terms of:

- firmness and elasticity of the skin
- brightness and turgor
- decrease of thin wrinkles

The regeneration system for dermal biogenesis is a treatment indicated both for young, still elastic and vital skin, to slow down the physiological ageing process, and for mature skin to reduce the signs of ageing, reactivating cellular functionality.

The Sunekos intradermal implant is one of the methods that can be used to reduce lines and wrinkles or to increase volumes. The effect is immediate and, generally no anaesthetic is required.

YOUR DECISION:

SUNEKOS

The product used, Sunekos 200 (or 1200), is duly present on the market and no allergic reactions to it have been reported to date, so its use does not require preliminary tests. The duration of the effect depends on multiple factors (individual characteristics, sun exposure, skin treatments, etc.). Doctors are the only individuals who are competent to judge whether the implant can be performed.

The treatment is carried out as follows:

- after disinfecting the area to be treated, the doctor inserts the needle or microcannula along the line or wrinkle, then withdraws it
- gradually, releasing the product at the same time;
- after the product has been injected the doctor may perform a gentle massage to shape the treated area.

I declare that I am aware of the following:

- that there is a possibility, at least in theory, that the components of the injected material may cause an allergy;
- that the percentage improvement of the defect to be corrected, the extent and duration of the result cannot be accurately predicted in advance;
- that it is not possible to establish the number of sessions required by any given patient. Two sessions are usually required in close succession (generally two weeks apart) to achieve effective filling;
- the intradermal implantation of biomaterials, such as hyaluronic acid, is considered a safe medical-surgical procedure; however,
- in some cases, as occurs in all medical procedures, the body may respond and react in way that is not always entirely predictable, such as, for example, the formation of bruises, hematomas, herpes or bacterial infections, oedemas, nodules, cysts and inflammation. These reactions can occur even if the medical-surgical procedure is carried out with skill, prudence and diligence;
- any complications and/or defects can be treated and/or corrected. To this end, I consent, to undergo treatments of the case in advance by the same doctor who treated me, without these other services involving an additional payment. I reserve the right to be referred to another doctor and, in this case, I hereby waive any claim against Dr . or any demand for compensation or indemnity for expenses incurred under the new doctor who treated me;
- I accept that non-invasive assessments (painless and harmless) and/or photographic recordings shall be carried out on myself before, during and after treatment. This documentation must only be used by the doctor for the purpose of clinical documentation in a scientific context and in an anonymous condition, in addition to evidential documentation in the event of dispute with the patient.

Initial:

I also declare:

- that I am in good health;
- that I have never suffered from allergies to injectable components;
- that I do not suffer from moderate or severe allergic syndromes;
- that I have informed Dr .. of any previous intradermal implants (type, date, outcome);
- that I have never undergone the interdermal implantation of permanent substances (silicone, gore-tex, polyacrylamide, etc.);
- that I do not suffer from autoimmune diseases;
- that I am not currently pregnant or breastfeeding;
- that I do not take anti-cancer, immunomodulatory or interferon drugs;
- that I do not take anticoagulants or antiplatelet agents(e.g. aspirin);
- that I am not currently pregnant or breastfeeding.
